IMPORTANT SAFETY NOTICES

PREVENTION OF PHYSICAL INJURY

1. Before disassembling or assembling parts of the digital duplicator, make sure that the power cord is unplugged.
2. The wall outlet should be near the printer and easily accessible.
3. If any adjustment or operation check has to be made with exterior covers off or open while the main switch is turned on, keep hands away from electrified or mechanically driven components.

HEALTH SAFETY CONDITIONS

1. If you get ink in your eyes by accident, try to remove it with eye drops or flush with water as first aid. If unsuccessful, get medical attention.
2. If you ingest ink by accident, induce vomiting by sticking a finger down your throat or by giving soapy or strong salty water to drink.

OBSERVANCE OF ELECTRICAL SAFETY STANDARDS

1. The digital duplicator must be installed and maintained by a customer service representative who has completed the training course on those models.

SAFETY AND ECOLOGICAL NOTES FOR DISPOSAL

1. Dispose of replaced parts in accordance with local regulations.
2. Used ink and masters should be disposed of in an environmentally safe manner and in accordance with local regulations.

Symbols

This manual uses several symbols. The meaning of those symbols are as follows:

	See or Refer to

CÓPIA NÃO CONTROLADA

CÓPIA NÃO CONTROLADA

CÓPIA NÃO CONTROLADA

INSTALLATION

CÓPIA NÃO CONTROLADA

CÓPIA NÃO CONTROLADA

CÓPIA NÃO CONTROLADA

1. INSTALLATION

1.1 INSTALLATION REQUIREMENTS

Carefully select the installation location because environmental conditions greatly affect machine performance.

1.1.1 OPTIMUM ENVIRONMENTAL CONDITION

1. Temperature: 10 to 30 °C (50 to 86 °F)
2. Humidity: 20 to 90 %RH
3. Install the machine on a strong and level base. The machine must be level within 5mm (0.2") both front to rear left to right.

1.1.2 ENVIRONMENTS TO AVOID

1. Locations exposed to direct sunlight or strong light (more than 1,500 lux).
2. Dusty areas
3. Areas containing corrosive gases.
4. Locations directly exposed to cool air from an air conditioner or reflected heat from a space heater. (Sudden temperature changes from low to high or vice versa may cause condensation within the machine.)

1.1.3 POWER CONNECTION

1. Securely connect the power cord to a power source.
2. Make sure that the wall outlet is near the machine and easily accessible.
3. Make sure the plug is firmly inserted in the outlet.
4. Avoid multi-wiring
5. Do not pinch the power cord.

1.1.4 MINIMUM SPACE REQUIREMENTS

Place the machine near a power source, providing minimum clearance as shown below.

1.1.5 DIMENSIONS

1.2 INSTALLATION PROCEDURE

1.2.1 MAIN BODY

Accessory Check

Make sure that you have all the accessories listed below.

Description	Q'ty
1. Master Spool	2
2. Paper Feed Side Pad	2
3. Operating Instructions.....	1
4. NECR (Ricoh version only).....	1
5. Model Name Plate (C252-72 and C252-92)	1 set
6. Paper Table	1 set
7. Paper Delivery Table	1 set

Installation Procedure

⚠ CAUTION

To avoid serious injury, do not connect the power plug to the machine until you are instructed to do so.

1. Unpack the machine and remove all the wrapping.
2. Remove all filament tape and string securing the covers and units as shown above.

Important note for installation:

A Styrene foam sponge is used to ensure that the rear shipping tape stays properly fixed in place, which prevents the printing pressure release lever from unlocking. At installation, please remove the rear tape by pulling the portion shown in the photo below toward the front of the machine.

Remove the tape and tag securing the Press Roller during transport.

If they are not removed, paper jams or blank images may occur, due to the lack of pressure on the Press Roller and the tape may stick to the drum screen or Press Roller.

3. Open the right side cover, and take out the accessory bag [A].

4. Insert both spools into a new master roll.

5. Install the master roll.

CÓPIA NÃO CONTROLADA

INSTALLATION PROCEDURE

6. Open the master making unit cover, and insert the leading edge of the master roll under the platen roller. The arrows [A] indicate the correct position of the master leading edge.

7. Close the master making unit cover [B] using both hands until it clicks into place.
8. Close the right side cover.

9. Open the front door.

10. Release the ink holder lock lever [A] and pull out the ink holder [B].

11. Insert a new ink cartridge.

12. Take the paper table and paper delivery table out of the box.

CÓPIA NÃO CONTROLADA

INSTALLATION PROCEDURE

13. Lower the paper feed tray adjustment lever [A], and install the paper table. (⌘ x 2)

- NOTE:** 1) When installing the paper table, make sure that the hooks [B] are set firmly.
- 2) Two side fence friction pads are included as accessories. They are not used normally, but if paper multi-feed frequently occurs or thin paper is used, the side fence friction pads can be installed to apply stopping pressure to the paper.

14. Attach the side and end fences, as shown. (⌘ x 3)

15. Install the paper delivery table. (⌀ x 2)

16. Release the paper feed side plate lock levers [A] and adjust the side plates to match the paper size.

CÓPIA NÃO CONTROLADA

INSTALLATION PROCEDURE

17. Load paper into the paper table.

18. Shift the paper feed tray adjustment lever [A] up to the paper feeding position.

19. Adjust the side and end fences of the paper delivery table to match the paper size.

20. Attach the original table [A].
21. Firmly insert the power plug in the outlet.
22. Turn on the main switch.
23. Press the clear/stop key while holding down the digit 0 key, to supply ink to the drum.
24. Make some test copies.

1.2.2 ADDITIONAL DRUMS (OPTION)

There are two types of drum units:

B4 size Color Drum: Color Drum Type 7 (M)

LG size Color Drum: Color Drum Type 7 (S)

1. Remove the protective sheet [A] from the drum unit.
2. Remove the tape securing the ink holder.
3. Attach a color indicator decal to the drum case. The decal must be the same color as the ink in use.
4. Remove the drum unit.
5. Leave the old master wrapped around the removed drum to protect the drum from dust and from drying.
6. Store the removed drum unit in the drum case.
7. Install the drum unit.
8. Remove the ink cartridge cap.
9. Insert the ink cartridge in the ink holder.

1.2.3 INTERFACE BOARD (OPTION)

Accessory Check

Check the quantity and condition of the accessories in the box against the following list:

Description	Q'ty
1. Interface Board	1
2. Interface Cable	1
3. Screw M3 x 6	2
4. Lock Screw	2
5. Washer	2

Installation Procedure

1. Remove the rear cover [A]. (⌀ x 5)
2. Remove the I/F connector cover [B]. (⌀ x 1)
3. Connect the I/F board [C] (accessories) to CN108 [D] on the MPU. (⌀ x 2)
4. Attach the cable [E] (accessories) to the connector bracket. (⌀ x 2)
5. Connect the connector [F] at the opposite end to the I/F board.
6. Re-install the rear cover.

REPLACEMENT AND ADJUSTMENT

CÓPIA NÃO CONTROLADA

CÓPIA NÃO CONTROLADA

3. REPLACEMENT AND ADJUSTMENT

3.1 GENERAL CAUTION

CAUTION

Turn off the main power switch and unplug the machine before attempting any of the procedures in this section.

3.2 COVERS

3.2.1 PANEL / FRONT COVERS

[A]: Panel (⌀ x 4,  x 2)

[B]: Front cover (⌀ x 6)

[C]: Front door (⌀ x 4)

Replacement
and
Adjustment

COVERS

3.2.2 REAR COVER

[A]: Rear cover (🔩 x 5)

3.3 BOARDS

3.3.1 MPU

Replacement
and
Adjustment

- Rear cover (➡ 3.2.2)
- [A]: MPU (🔧 x 8, 📁 x 8)

NOTE: 1) Check the dip switch settings on the old MPU and make the dip switch settings [B] the same on the new MPU.
 2) Adjust the master end sensor (➡ 3.5.4) after installing the new MPU.
 3) Adjust the ink detection (➡ 3.9.6) after installing the new MPU.
 4) Ensure that the EPROM on the MPU contains the correct firmware.

BOARDS

3.3.2 PSU

- Rear cover (➡ 3.2.2)
- [A]: PSU (🔩 x 6, 📡 x 3)

NOTE: When the PSU is replaced, the thermal head voltage returns to the default. Adjust the thermal head voltage (➡ 3.5.3) after installing the new board.

3.4 SCANNER

3.4.1 COVERS

[A]: Right side cover (🔩 x 2)

[B]: Scanner cover (🔩 x 4)

Replacement
and
Adjustment

3.4.2 1ST, 2ND FEED ROLLER / CIS (CONTACT IMAGE SENSOR)

- [B]: Guide plate (⌘ x 2)
- [C]: CIS (⌘ x 1)
- [D]: 1st feed roller (⌘ x 3)
- [E]: 2nd feed roller (⌘ x 3)

3.4.3 DOCUMENT SENSOR

[A]: Upper guide plate (🔩 x 2)

[B]: Document sensor (🔌 x 1)

Replacement
and
Adjustment

3.4.4 SCANNER MOTOR

[A]: Scanner unit (🔩 x 5, 🔌 x 3)

[B]: Scanner motor (🔩 x 2, 🔌 x 1)

MASTER FEED

3.5 MASTER FEED

3.5.1 MASTER MAKING UNIT

[A]: Master making unit ( x 2,  x 5)

3.5.2 THERMAL HEAD

- Master making unit (☛ 3.5.1)

[A]: Open the platen roller unit.

[B]: Thermal head upper cover (☛ x 2)

[C]: Thermal head side cover (☛ x 1)

- Close the platen roller unit.

[D]: Thermal head (☛ x 2)

Replacement
and
Adjustment

Installation

If the following cautions are not followed, the thermal head will be installed incorrectly.

1. Fit the base's springs [A] over the protrusions [B] on the underside of the thermal head (5 points).
2. While fitting the tops of the springs [A] over the protrusions on the underside of the thermal head, hook the lock pawls [C] of the thermal head onto the base (3 lock pawls). Make sure to set the front side (the paper table side) first.
3. Make sure that all protrusions are properly fitted into the springs.

NOTE: 1) Adjust the thermal head voltage (➡ 3.5.3) after installing the new thermal head.
 2) Don't touch the surface of the thermal head with bare hands. (If you touch it, clean the surface with alcohol.)
 3) Don't touch the terminals of the thermal head connectors with bare hands.

3.5.3 THERMAL HEAD VOLTAGE ADJUSTMENT

⚠ CAUTION

This adjustment is always required when the thermal head or PSU has been replaced.

Purpose: To maintain master making quality and extend the lifetime of the thermal head.

Standard: Refer to the voltage value (X) printed on the thermal head. The value varies from one thermal head to another.

The adjustment voltage should be between X and X - 0.1 V.

Tools: Circuit tester

- Rear cover (➡ 3.2.2)
- Read the voltage value on the decal on the thermal head.

1. On the power supply unit (PSU), connect the positive terminal of a circuit tester to TP701 and the negative terminal to TP702 on the PSU.

CAUTION: If the output and ground terminals touch each other, the board will be damaged.

2. Connect the power plug, and turn on the main switch to access SP mode. (➡ 5.1.1)
3. Select SP2-41 (Thermal head signal output). (➡ 5.1.4)
4. Press the # key. Power is continuously supplied to the thermal head, which could damage the thermal head, so press the clear/stop key if you cannot finish the adjustment quickly. Wait several seconds and repeat the procedure. A beeper sounds while the power is being supplied.
5. Measure the voltage, and turn VR1 on the PSU until the value is between "+0" and "-0.1" volts from the value on the thermal head decal.

Replacement
and
Adjustment

MASTER FEED

3.5.4 MASTER END SENSOR ADJUSTMENT

Purpose: To ensure that the sensor detects the end mark (a solid black area) on the master roll.

Standard: 2.0 ± 0.1 volts

Tools: The core of a used master roll (the core just before a master end display appears)

- Rear covers (➡ 3.2.2)

1. Place the core inside the master making unit, and close the master making cover.
2. Connect the power plug, and turn on the main switch.
3. Access SP6-41.

4. Turn VR102 [A] on the MPU board until the display is 2.0 ± 0.1 volts.

3.6 MASTER EJECT

3.6.1 MASTER EJECT UNIT

- [A]: Paper delivery cover (🔩 x 5)
 [B]: Master eject box
 [C]: Master eject unit (🔩 x 2, 📄 x 3)

3.6.2 MASTER EJECT ROLLERS

- Master eject unit (➡ 3.6.1)
- [A]: Gears (⌚ x 1)
 [B]: Lower master eject roller (⌚ x 2)
 [C]: Upper master eject roller (⌚ x 2, spring)

PAPER FEED

3.7 PAPER FEED**3.7.1 PAPER FEED ROLLER / FRICTION PAD**

[A]: Paper feed roller unit (ꣳ x 1)

[B]: Paper guide

[C]: Paper feed roller (ꣳ x 1)

[D]: Friction pad

3.7.2 PAPER FEED PRESSURE ADJUSTMENT

The position of the spring can be changed in order to change the amount of pressure exerted by the paper tray adjustment plate.

This adjustment can be done:

- When feeding special paper (especially thick paper and thin paper)
- When the customer is experiencing feed problems.

- Front cover (☛ 3.2.1)

Increase the feed pressure: [A] → [B] → [C] → [D]

Decrease the feed pressure: [E] → [F] → [G] → [H]

Default position: [A] and [E] positions

3.7.3 PAPER SEPARATION PRESSURE ADJUSTMENT

The position of the screw can be changed in order to change the amount of pressure exerted by the friction pad.

This adjustment can be done:

- When feeding special paper, especially thick paper
- When the customer is experiencing feed problems.

- Remove the paper table
- Move the separation pressure slider [A] to position 1 (right end).

Increase the paper separation pressure: Move up the screws [B]

Decrease the paper separation pressure: Move down the screws [B]

Default position: lowest position

For more details: See section 6.7.3

3.8 PRINTING

3.8.1 PRESS ROLLER

Replacement
and
Adjustment

⚠ CAUTION

Take care to avoid possible injury. If the printing pressure release arms disengage, the press roller will be pulled upwards suddenly.

- Remove the drum
- [A]: Press roller (🔧 x 1)

The bearings on the rear and front differ. During installation, ensure that the bearing with the stopper [B] is positioned towards the rear of the machine.

3.8.2 PAPER REGISTRATION ROLLER

- Remove the paper table
- Front cover (☛ 3.2.1)
- Rear cover (☛ 3.2.2)
- MPU (☛ 3.3.1)

[A]: Registration motor (spring, ④ x 3, belt ④ x1)

[B]: Gear

[C]: Bearing (④ x 2)

- [A]: Bearing (1/2" x 2)
[B]: Slider bracket (1/2" x 2)
[C]: Plate (1/2" x 4)
[D]: Registration roller

Replacement
and
Adjustment

3.8.3 PRESS ROLLER RELEASE LEVER ADJUSTMENT

Purpose: To maintain the correct clearance between the press roller arms and press roller lock levers. This ensures that the press roller is correctly released and pressed against the drum when the press roller release solenoid is energized.

Standard: 0.7 to 1.2 mm

Tools: Thickness gauge

- Front cover (☛ 3.2.1)
 - Rear covers (☛ 3.2.2)
1. Turn the drum manually until the drum master clamber on the drum moves into the lowest position. (This is when the high points of the cams on the drum flanges meet with the cam followers on both ends of the press roller.)
 - To find out the correct position of the drum for the adjustment, look at the rear end of the drum shaft. The recess on the drum drive gear meets the hole [A] in the bracket when the drum is in the correct position.
 2. Using a thickness gauge, measure the clearance [B] between the press roller arm [C] and the press roller lock lever [D] (rear side). It should be between 0.7 and 1.2 mm.
 3. If it is not correct, adjust the position of the press roller lock lever after loosening the two screws [E].
 4. Repeat steps 2 and 3 for the front side.

3.8.4 PRINTING PRESSURE ADJUSTMENT

Purpose: To make better print results without decreasing the run length.

Standard: Within 10 ± 0.5 mm

Replacement
and
Adjustment

- Paper delivery unit (☛ 3.10.1)

1. Adjust the distance [A] to 10 ± 0.5 mm by turning the adjusting bolt [B].
2. Repeat the same procedure for the printing pressure spring at the non-operation side.

DRUM

3.9 DRUM**3.9.1 PREPARATION**

Before attempting any of the procedures in this section, wipe off the ink around the ink roller. To do this, set SP3-6 (ink detection) to off, and feed paper until the ink ends. The setting value returns to the default value when power is switched off/on.

3.9.2 CLOTH SCREEN

- Remove the drum

1. Remove the drum upper bracket (⚙ x 4).
2. Release the stopper [A], then rotate the drum until the master clasper faces top.
3. Remove the cloth screen [B] (⚙ x 4).

Installation
 Replacement
and
Adjustment

- Do not scratch the cloth screen or metal screen.
- Properly insert the edge of the mylar [A] on the cloth screen under the mylar [B] on the metal screen, as shown above.
Otherwise, ink will leak from the trailing edge of the master on the drum during a long printing run.
- Make sure that the correct side of the screen is facing up. In addition, make sure that the stays for securing the cloth screen are positioned correctly. (Refer to the upper right illustration.)
- When replacing the cloth screen, spread the screen around the metal screen while strongly pulling the stay [C]. Adjust the stay so that it is parallel to the master clasper, then tighten the screws.
- Make sure that the cloth screen is not wrinkled while spreading it around the drum.

DRUM

3.9.3 CLAMPER / METAL SCREEN

- Remove the drum
- Cloth screen (➡ 3.9.2)

[A]: Clamber lever (1 hexagon screw)

[B]: Clamber - open the clamping plate [C], then remove the clamber.

NOTE: 1) Do not allow ink to get on the inside of the clamping plate [C].

Otherwise, the master may slip off and the image position on the prints will move toward the trailing edge of the prints during a printing run.

- 2) Use a cloth dampened with water to clean the inside of the clamping plate [C]. Never use alcohol or other solvents, or the clamping force of the magnet will be weakened.

[D]: Tape (do not lose it)

[E]: Metal screen (⌘ x 12)

Installation

- Make sure that the correct end of the metal screen is overlapping. (The right side overlaps, as viewed from the non-operation side, as shown above.)
- The 4 screws holding the drum master clasper are longer than the 12 screws holding the metal screen, although they are similar in appearance. Be careful not to mix them up or use the wrong screws.
- When installing the metal screen, secure the trailing edge first with the 2 screws. Then, tighten the other screws while removing the slack from the screen. Make sure that the gap between the drum flanges and the screen is 0.3 mm or less, as shown above. (The two holes [A] on the trailing side are round holes and the other holes are long holes, to allow for the removal of the slack.)
- Position the springs [B] and [C] (one each at the front and rear) as shown when reinstalling the drum master clasper [D].
- Do not scratch the cloth screen or metal screen.

DRUM

3.9.4 INK PUMP ADJUSTMENT

Purpose: To ensure the smooth operation of the ink pump plunger by properly positioning its holder.

- Remove the drum
- Cloth screen (☞ 3.9.2)
- Clamper / Metal screen (☞ 3.9.3)

1. Remove the E-ring [A] to free the plunger from the pump drive slider [B].
2. Loosen the two screws securing the holder [C]. (Do not remove the holder.)
3. Push the plunger [D] until it reaches the bottom.

NOTE: The end of the plunger [D] should project 1mm outside from the holder [C].

4. Check that the piston motion is smooth.
5. If the motion is stiff, loosen the pump screws [E] and adjust the pump position.
6. After tightening, repeat step 4 and step 5.

Replacement
and
Adjustment

7. Re-tighten the two screws [A].
8. Check that the piston motion is smooth.
9. Reinstall the E-ring [B].

DRUM

3.9.5 DOCTOR ROLLER GAP ADJUSTMENT

Purpose: To control the ink thickness around the ink roller.

Standard: A 0.07mm gauge passes, but a 0.09mm gauge does not.

Tools: Thickness gauge

⚠ CAUTION

Normally the doctor roller gap is not adjusted or changed. It tends to be difficult to change in the field. If the gap is too narrow, an uneven image may appear on the prints. If it is too wide, too much ink will be applied to the drum screens, resulting in ink leakage from the drum.

- Wipe off the ink around the ink roller beforehand. (Use SP3-6.)
 - Remove the drum
 - Remove the Ink roller unit
1. Make sure that a 0.07 mm gap gauge goes through the gap [A] between the ink and doctor rollers, and that a 0.09 mm gap gauge does not.

NOTE: 1) The gap should be checked at both ends of the doctor roller. Insert a gap gauge at each end of the roller. The gap tends to be larger for the center.

2) While the gap gauge is inserted, hold the doctor and ink rollers with your fingers in order to stop the rollers from rotating.

3) While the gap gauge is inserted, hold the end of the gap gauge.
 2. If the gap is out of the standard, loosen the screw [B] and adjust the gap by turning the cam bushing [C] for the front and for the rear.

NOTE: Make sure to repeat the adjustment for both ends of the rollers.

3.9.6 INK DETECTION ADJUSTMENT

Purpose: To ensure that the CPU detects a no ink condition.

CAUTION: Before attempting this procedure, wipe off the ink around the ink roller. To do this, set SP3-6 (Ink Detection) to OFF, and feed paper until the ink ends. The setting value returns to default value if the power is switched off/on.

Standard: $4.0 \pm 0.2\mu\text{s}$

Replacement
and
Adjustment

- Rear cover (➡ 3.2.2)

1. Access SP6-40.
2. Turn VR101 [A] on the MPU board until the display is " $4.0 \pm 0.2\mu$ " ($4.0 \pm 0.2\mu\text{s}$).

NOTE: When the drum has ink inside, the machine displays "----".

PAPER DELIVERY

3.10 PAPER DELIVERY

3.10.1 PAPER DELIVERY UNIT

- Rear cover (➡ 3.2.2)

[A]: Paper delivery cover (🔩 x 5)

[B]: Paper delivery unit (🔩 x 2, 📏 x 2, 📏 x 1)

3.10.2 DELIVERY BELT / PAPER EXIT SENSOR

Replacement
and
Adjustment

- Remove paper delivery unit (☛ 3.10.1)
- [A]: Vacuum fan motor bracket (🔩 x 4, 🛠️ x1)
- [B]: Delivery belts
- [C]: Paper exit sensor (🛠️ x 1)

3.10.3 VACUUM FAN MOTOR POSITION

- Remove the paper delivery unit (➡ 3.10.1)

[A]: For the China model

[B]: For other models

3.10.4 EXIT PAWL ADJUSTMENT

Purpose: To ensure that the exit pawls can move out of the way of the drum master clasper while the drum is rotating.

Clearance adjustment

Standard: Within 1.15 ± 0.15 mm

- Front cover (☛3.2.1), Rear cover (☛3.2.2)

1. Loosen screw [A] then screw [B] in this order (do not remove them). Make sure that the bracket [C] becomes free from engagement and the cam follower [D] contacts the drum flange.
2. Using a gap gauge, measure the clearance [E] between the drum surface and the exit pawls. It should be 1.15 ± 0.15 mm.
3. If the clearance is not correct, adjust the clearance by turning the bolt [F].
4. Reposition the bracket [C] and tighten the screws [A] and [B].
5. Do the timing adjustment (see the next section).

PAPER DELIVERY

Timing adjustment**Standard:** 0 or less than 0.5 mm

- Front cover (☛ 3.2.1), Rear covers (☛ 3.2.2)

Do this after the clearance adjustment (the procedure is on the next page).

1. Turn the drum manually until the recess in the drum drive gear meets the positioning hole [A] in the bracket, as shown.
2. Loosen screw [B] then screw [C] in that order (do not remove them). Make sure that the bracket [D] becomes free from engagement and the cam follower [E] contacts the drum flange.
3. Measure the gap [F] between the cam follower and cam face (front drum flange). It should be 0 to 0.5 mm.
4. If the gap is not correct, loosen the two screws securing the cam follower bracket [G].
5. Re-tighten the two screws while pushing the cam follower against the cam face. Make sure that the gap [F] is 0 or less than 0.5 mm.
NOTE: Do not push the cam followers too strongly against the cam.
6. Re-position the bracket [D] and tighten the screws [B] and [C].

MAIN DRIVE

3.11 MAIN DRIVE**3.11.1 MAIN DRIVE TIMING BELT ADJUSTMENT**

After the timing belt is replaced, correct belt tension must be applied.

- Rear cover (➡3.2.2)
- MPU (➡3.3.1)
- PSU (➡3.3.2)

1. Loosen the screws [A], [B], and [C].
2. Move the tension roller [D] to the right with a screwdriver [E] as shown.
3. Tighten the screws [A], [B], and [C].
4. Remove the screwdriver.

3.11.2 MAIN MOTOR PULLEY POSITION

After putting the pulley back on the main motor shaft, refer to the above illustration for the correct position of the pulley.

Replacement
and
Adjustment

3.12 FIRMWARE UPDATE

The firmware in the EPROM on the MPU can be upgraded replacing the EPROM.

1. Before upgrading the firmware, check the current suffix version with SP3-1.
2. Turn off the main switch and disconnect the power plug.
3. Remove the rear cover.
4. Replace the EPROM on the MPU.
5. Connect the power plug and turn on the main switch.
6. Access SP3-1 and confirm that the suffix version was changed.

TROUBLESHOOTING

CÓPIA NÃO CONTROLADA

JAM DETECTION

4.4 JAM DETECTION**4.4.1 MASTER EJECT JAM (E JAM LOCATION INDICATOR)*****Picking up the used master from the drum******Check 1:***

When the drum has rotated, if the master eject sensor doesn't detect the master, the E jam indicator lights.

Check 2:

When the feed start timing sensor turns on, if the master eject sensor has already turned off, the E jam indicator lights.

Compressing the used master

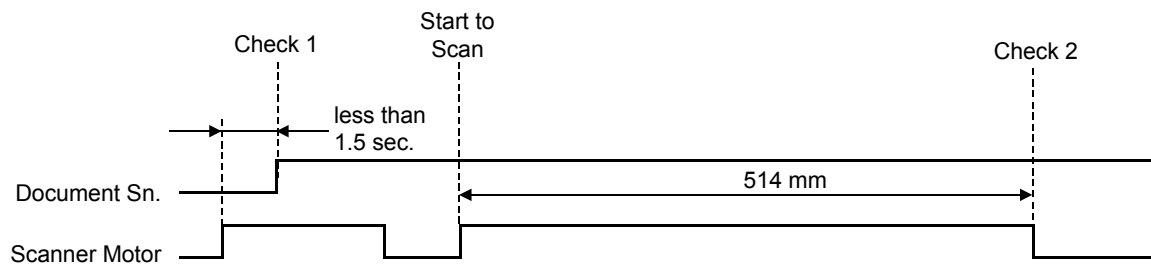

C252T902.WMF

Check:

If the master eject sensor detects a master when the pressure plate limit sensor turns on, the E jam indicator lights.

Just after turning on the main switch***Check:***

If the master eject sensor is on (master detected), the E jam indicator lights.

4.4.2 SCANNER JAM (P JAM LOCATION INDICATOR)***Feeding in the original******Check:***

If the document sensor detects an original when the master making key was pressed, the P jam indicator lights.

Check 1:

If the scanner has fed the original for 1.5 seconds since the master making key was pressed, and the document sensor still doesn't detect the original, the P jam indicator lights.

Feeding out the original***Check 2:***

When the scanner has fed out the correct length, but the document sensor still detects the original, the P jam indicator lights.

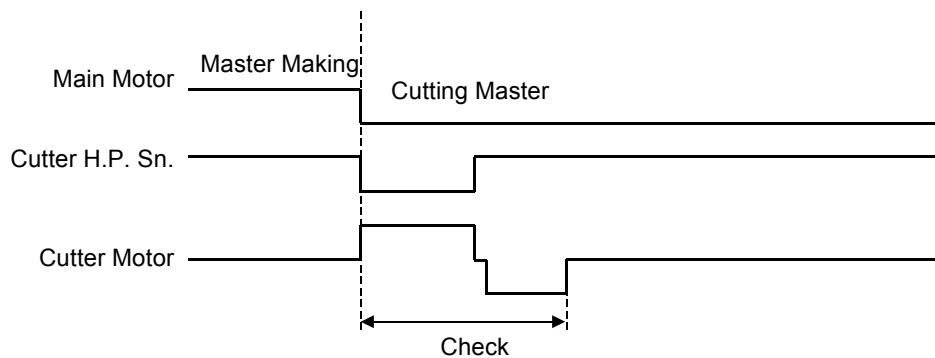

Just after turning on the main switch***Check:***

If the document sensor detects an original, the P jam indicator lights.

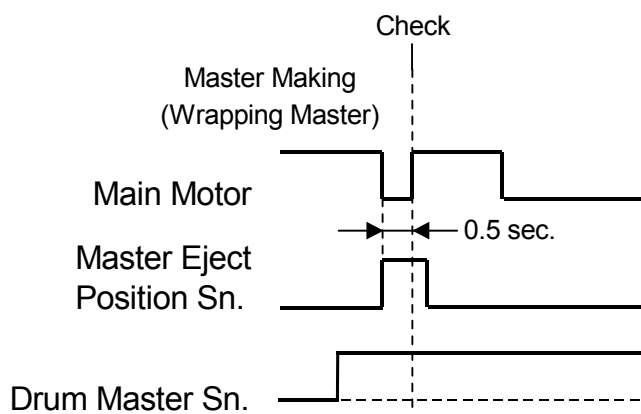

JAM DETECTION

4.4.3 MASTER FEED JAM (D JAM LOCATION INDICATOR)***Cutting the master (master not cut)******Check:***

While the drum is rotating from when the cutter home position sensor turns on (cutter at home position) until the master eject position sensor turns on (drum at master eject position), if the drum master sensor doesn't detect a master on the black patch on the drum clamper, then the D jam indicator lights.

Cutting the master (cutter unit problem)***Check:***

During master cutting, if the cutter HP sensor does not turn on (the cutter does not reach home position) at the desired time, then the D jam indicator lights.

Clamping the master**Check:**

When the master eject position sensor turns on (drum at master eject position) after 0.5 second, if the drum master sensor doesn't detect a master, then the D jam indicator lights.

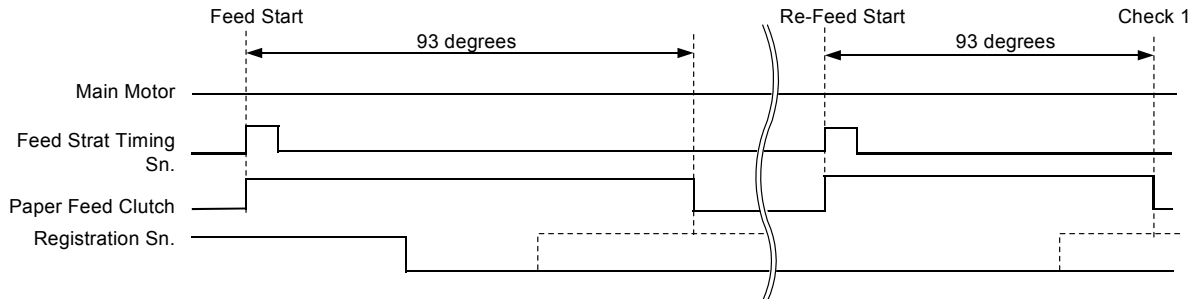

4.4.4 DRUM JAM (B JAM LOCATION INDICATOR)**Wrapping jam****Check 1:**

When the drum has turned 360 degrees since the feed start timing sensor turned on, and the paper exit sensor still doesn't detect the paper, then the B jam indicator lights.

Check:

At the same time as check 1, if the paper exit sensor doesn't detect the paper and the registration sensor is on, then the A and B jam indicators light.

JAM DETECTION

4.4.5 PAPER FEED JAM (A JAM LOCATION INDICATOR + 📄 + 📄)***Paper feed******Check 1:***

If the registration sensor does not detect paper after the drum has turned 93 degrees, the feed clutch stops until the drum reaches the feed start position again, then the feed clutch turns on again (this is 're-feeding'). If the registration sensor still doesn't detect paper after the drum has turned 93 degrees since re-feeding started, the A jam location, 📄, and 📄 indicators light.

Note that the machine also follows this pattern if the tray is empty. There is no paper end sensor; the registration sensor is used to detect paper end.

Just after turning on the main switch***Check:***

If the registration sensor detects paper, the A and B jam location indicators light.

4.4.6 PAPER DELIVERY JAM (C JAM LOCATION INDICATOR)

Paper delivery

Check 1:

When the drum has turned 273 degrees since the feed start timing sensor turns on, if the paper exit sensor detects paper, the C jam location indicator lights.

Just after turning on the main switch

Check:

If the paper exit sensor detects paper, the C jam location indicator lights.

NOTE: The Service Program Mode is for use by service representatives only so that they can properly maintain product quality. If this mode is used by anyone other than service representatives for any reason, data might be deleted or settings might be changed. In such case, product quality cannot be guaranteed any more.

5.1 SERVICE PROGRAM MODE

The service program (SP) mode is used to check electrical data, change modes.

5.1.1 SERVICE PROGRAM MODE OPERATION

To Enter and Exit the SP Mode

1. Key in the following sequence.

Method 1:

☒ → ① → ⑦ → ⑦ → C/Ⓢ

Hold down Clear/Stop C/Ⓢ for more than three seconds.

Method 2:

☒ → C/Ⓢ → Combine Key → #

2. The SP number is displayed. (e.g. SP1)

3. To exit SP mode, press Clear Modes/Recovery ☒.

Using the SP mode

SP command numbers can be entered directly.

1. Using the number keys, enter the desired main-menu number, then press the Enter key.
2. Using the number keys, enter the desired sub-menu number, then press the Enter key.
3. Enter the desired value using the number keys.
4. Press the enter key to store the displayed setting.

5.1.6 SP3-1: FIRMWARE SUFFIX INFORMATION

This model has no LCD, so the suffix is displayed as shown below instead of in Latin letters.

NOTE: The letters “i”, “o” and “u” are always skipped.

5.1.7 MAIN MENU NO.6: ADJUSTMENT MODE

No.	Name	Function
6-40	Ink Detection Adjustment	☛3.9.6
6-41	Master End Sensor Adjustment	☛3.5.4
6-42	Image Adjustment Pattern Print	☛5.1.8

5.1.8 SP6-42: IMAGE ADJUSTMENT PATTERN PRINT

This test pattern is used for master feeding speed adjustment.

- Master Feeding Speed Adjustment: ➡ 5.2.6

This test pattern is generated in the MPU, and does not use the scanner unit. So, this pattern can also be used to determine whether an image problem is caused by the scanner or the thermal head.

- If there is an image problem during copying but the test print is OK, the problem could be in the scanner unit.

The print paper should be B4 or LG size when using this test pattern.

DIP SWITCHES

5.2 DIP SWITCHES**5.2.1 OVERVIEW**

5.2.2 DIPSW101 NO.1 TO 4 – PAPER REGISTRATION POSITION ADJUSTMENT

Purpose: To match the printing leading edge on the print paper with that on the original.

Adjustment standard: ± 1.0 mm

The print position moves as shown below.

NOTE: The image position on a trial print, which is automatically made after making a master, tends to vary. Do not use the trial print when making adjustments.

5.2.4 DIPSW102 NO.1 TO 3 – THERMAL HEAD ENERGY CONTROL

The default is -7%. This means that during printing mode, the thermal head energy is 93 % of the maximum power.

This can help to increase or decrease the image density. However, do not use this SP under normal circumstances.

DIP SWITCHES

5.2.5 DIPSW103 NO.1 TO 4 – SCANNING SPEED ADJUSTMENT

Purpose: To adjust the sub-scan magnification for scanning by changing the speed of the scanner motor.

Inputting a positive value stretches the image on the master. Inputting a negative value shrinks it.

Adjustment standard: Within $100 \pm 0.5 \%$

1. Make a copy at 90 cpm (speed “Fast”)
2. Compare the image on the print with that on the original.
3. Make sure that the difference of the sub-scan magnification is within the standard.
4. If it is out of standard, then adjust DIPSW103-1 to 103-4.

NOTE: The image position on a trial print, which is automatically made after making a master, tends to vary. Do not use the trial print when making adjustments.

DIPSW103-1	DIPSW103-2	DIPSW103-3	DIPSW103-4	Difference

5.2.6 DIPSW103 NO.5 TO 8 – MASTER FEEDING SPEED ADJUSTMENT

Purpose: To adjust the sub-scan magnification for the master by changing the speed of the master feed motor.

Inputting a positive value stretches the image on the master. Inputting a negative value shrinks it.

Adjust standard: 300 ± 0.5 mm

1. Access SP6-42 (Image Adjustment Pattern Print), and then press the master making key. (5.1.8)
2. Exit the SP mode, print 5 copies at 90 cpm (speed “Fast”). Use the 5th print for the adjustment.
3. The black area should be 300 ± 0.5 mm in length.
4. If it is out of the standard, then adjust DIPSW103-5 to 103-8.

$$\{(300 - \text{Value}) / 300\} \times 100 = \pm X.X \%$$

6.1.2 ELECTRICAL COMPONENT LAYOUT

Boards

No.	Component	Function
13	Operation Panel Board	This board controls the operation panel.
34	Main Processing Unit (MPU)	Controls all machine functions, both directly and through other boards.
37	Power Supply Unit (PSU)	Provides dc power to the machine.

Motors

No.	Component	Function
2	Scanner Motor	Drives the scanner.
4	Ink Pump Motor	Drives the ink pump.
5	Master Feed Motor	Feeds the master to the drum.
11	Cutter Motor	Cuts the master.
22	Master Eject Motor	Sends used masters into the master eject box.
23	Air Knife Fan Motor	Rotates the fan to provide air to separate the leading edge of the paper from the drum.
26	Vacuum Fan Motor	Provides suction so that paper is held firmly on the transport belt.
27	Pressure Plate Motor	Drives the pressure plate.
29	Clamper Motor	Opens or closes the master clamper on the drum.
31	Main Motor	Rotates the drum, paper feed roller and transport belts.
33	Registration Motor	Feeds the paper to align it with the master on the drum.

Switches

No.	Component	Function
7	Right Side Cover Set Switch	Checks if the right side cover is closed.
14	Door Safety Switch	Checks whether the front door is properly closed.

Solenoids

No.	Component	Function
12	Front Pressure Release Solenoid	Releases the press roller to apply printing pressure.
30	Rear Pressure Release Solenoid	Releases the press roller to apply printing pressure.

Counters

No.	Component	Function
20	Master Counter	Keeps track of the total number of masters made.
21	Paper Counter	Keeps track of the total number of copies.

MECHANISM OVERVIEW

Sensors

No.	Component	Function
3	Cutter HP Sensor	Detects when the cutter is at the home position.
8	Master Set Cover Sensor	Checks if the master set cover is properly set.
9	Master End Sensor	Detects when the master making unit runs out of master roll.
10	Registration Sensor	Detects paper approaching the registration roller.
15	Document Sensor	Detects the leading edge of the original to determine when to turn off the scanner motor. Checks for original misfeeds.
16	Pressure Plate HP Sensor	Detects when the pressure plate is at the home position.
17	Pressure Plate Limit Sensor	Detects when the pressure plate is in the lowest position.
18	Master Eject Sensor	Detects used master misfeeds.
19	Drum Master Sensor	Detects if there is a master on the drum.
24	Eject Box Set Sensor	Checks if the master eject box is installed.
25	Paper Exit Sensor	Detects paper misfeeds at the exit.
28	Clamper Open Sensor	Detects if the clamper is in the open position.
32	Feed Start Timing Sensor	Determines the paper feed start timing.
36	Clamper Closed Sensor	Detects if the clamper is in the closed position.
38	Master Eject Position (Drum HP) Sensor	Detects when the drum is at the master eject position.

Others

No.	Component	Function
1	Contact Image Sensor (CIS)	This sensor reads and converts the light reflected from the document into an analog video signal.
6	Thermal Head	Burns the image onto the master.
35	Paper Feed Clutch	Transmits main motor drive to the paper feed rollers at the appropriate time.

6.1.3 DRIVE LAYOUT

Detailed
Descriptions

6.2 MASTER EJECT UNIT

6.2.1 OVERVIEW

The master eject unit removes the used master from the drum. (🔊📖: Digital Duplicators – Duplicating Process – Master Ejecting)

Procedure

The drum turns to the master eject position. Then the clasper [A] opens. The drum, driven by the main motor can only rotate in one direction, clockwise (when viewed from the front of the machine).

Master eject rollers [B] pick-up the master's leading edge and feed the master for 0.6 seconds into the master eject box [C].

The clasper then closes.

The drum then turns at 30 rpm while the master eject rollers continue to feed the used master into the eject box.

The drum stops after making about 1.5 turns. The master eject motor also stops. The pressure plate [D] then compresses the used masters in the eject box.

- The capacity is 30 used masters (under normal conditions)
- The master eject process is skipped when the drum master sensor [E] detects no master on the drum.

6.2.2 MASTER CLAMPER OPENING MECHANISM

Clamper Mechanism

Clamper motor [A] - opens the clamper at the master eject position

↓
 Gears [B]
 ↓
 Link [C]
 ↓
 Drum guide [D] - moves and engages the pin on the rear flange of the drum
 ↓
 Lifts the clamper lever [E], and engages the drum pin [F]
 ↓
 The lever [E] lifts the master eject arm [G] to release the master's leading edge [H] from the clamper.

- NOTE:**
- 1) After the master making key is pressed and before the clamper motor starts, the master eject position sensor [I] is checked (the drum must be at the master eject position).
 - 2) The sensor actuators on the link [C], the clamper open sensor [J], and the clamper close sensor [K] determine the clamper open and close positions.
 - 3) The master clamper uses a magnetic plate to clamp the master's leading edge.
 - 4) The drum guide catches the drum at the master eject position while the master clamper is being opened. When the clamper motor turns on in reverse direction to close the clamper, the drum guide also disengages the pin and the drum can turn.

6.2.3 MASTER EJECT ROLLER MECHANISM

Mechanism

Master eject motor [A]

Gears [B]

Master eject rollers [C] – the upper roller has paddles

Pick up the master and feed it into the master eject box

Procedure

1. When the clamber is open and the master's leading edge is released from the clamber, the master eject motor turns on for 0.6 seconds to pick up the leading edge of the used master.
2. Then, the clamber motor reverses direction to close the clamber.
3. The drum then starts turning at the slower speed (30 rpm). At the same time, the master eject rollers turn again to feed the master into the master eject box. The drum rotates for approximately 1.5 rotations, stopping at the master feed position.
4. When the drum reaches the master feed position, the master eject and drum motors stop. The master feed position is 111 encoder pulses after the feed start timing sensor is actuated.
5. During this process, the master eject sensor [D] detects master eject jams.
(☛4.4.1)

6.2.4 PRESSURE PLATE MECHANISM

Mechanism

Pressure plate motor [A]

Gears [B]

Pressure plate rotates

Compresses the masters

Procedure

1. After the master has been ejected and the drum is stopped at the master feed position, the pressure plate motor turns until the actuator on the pressure plate actuates the limit sensor [D].
2. After master making and cutting, the motor reverses until the pressure plate home position sensor [C] is actuated, then it stops.
3. If the pressure plate limit sensor is not actuated within 2.8 seconds after the pressure plate motor rotates, the Full Master Eject Box indicator lights.
4. The idle gear [E] has a clutch to prevent motor overload.

SCANNER UNIT

6.3 SCANNER UNIT**6.3.1 SCANNER DRIVE*****Mechanism***

Scanner motor [A]

Gears [B]

1st feed roller [C], 2nd feed roller [D] rotate

Feed the original

Procedure

1. When the master making key is pressed, the 1st/2nd feed rollers start moving the original forward at the same time.
2. The scanner motor stops at the original scanning position.
3. After the master eject process is finished, the master feed motor rotates and then the scanner motor turns on.
4. The scanner motor is turned off when the original is fed 60 mm after the document sensor switches off.

6.4 IMAGE PROCESSING

6.4.1 IMAGE PROCESSING FLOW

Image processing is done by the IPU (Image Processing Unit) on the MPU board, following the steps shown below.

Shading Correction

Gamma Correction

MTF Filtering

Grayscale Processing

Shading Correction:

Corrects errors in the signal level for each pixel using the white plate.

Gamma Correction:

Background erase

MTF Filtering:

Reduces the contrast.

Grayscale Processing:

Compares each pixel with surrounding pixels to enhance the image.

- Text mode: Binary processing
- Photo mode: Error diffusion

6.5 MASTER FEED

6.5.1 OVERVIEW

The master feed unit makes an image on the master and feeds the master to the drum. (👁️📖 **CT**: Digital Duplicators – Duplicating Process – Master Feeding)

Procedure

The machine feeds the master from the master roll [A].

The thermal head [B] burns (plots) holes to create an image on the master.

Clamber [C] opens. (The drum is at the master feed position.)

The clamber clamps the leading edge of the master. At this time, the cutter [D] cuts the trailing edge of the master.

The master is wrapped around the drum [E].

6.5.2 MASTER FEED MECHANISM

Mechanism

Master feed motor [A] (stepper motor)

Gears [B]

Platen roller [C], master feed roller [D]

Feeds the master (The thermal head creates an image on the master.)

Procedure

1. After the old master has been ejected, the drum stops at the master feed position and the master clamber opens, ready to clamp the new master.
2. When the clamber is open, the tension roller releases and the master is fed to the clamber on the drum. For details of the tension roller, see section 6.5.3.
3. After the clamber closes, the master feed motor feeds the master while the drum rotates intermittently at 30 rpm. The intermittent rotation keeps a buckle [F] in the master above the master feed guide to absorb shocks from the wrapping operation.
4. The tension roller [E] keeps the master under tension. This roller reduces the master making time, because it allows the drum to turn continuously during wrapping. Without this roller, if the drum kept turning, the master would crease.
5. The main motor turns off when the drum is at the master eject position. The master feed motor continues to feed the master until master making completed. Then the master feed motor turns off, and cutting is done.

NOTE: Springs press the thermal head against the platen roller. The pressure is applied when the master set cover, which includes the platen roller, is closed.

6.5.3 CLAMPER AND TENSION ROLLER MECHANISM

Mechanism

Clamber motor [A]

Gears [B]

Link [C]

Drum guide [D]

Lifts the lever [E], engages and locks the drum pin [F], opens the clamber plate [G].

Releases the tension roller [H].

Feeds the master into the clamber.

Procedure

- When the old master has been ejected, the drum is stopped at the master feed position. The master clamber clamps the leading edge of the new master before the drum starts to turn again.
- The tension roller [H] normally presses against the master feed guide plate to apply tension to the master during master wrapping. When the clamber opens, it pushes the tension roller arms [I] and moves the tension roller away from the guide plate to allow the master to be fed into the master clamber.
- Clamber mechanism: See the Master Eject section 6.2.

6.5.4 CUTTER MECHANISM

[A]: Cutter motor

[B]: Cutter HP sensor

- When the cutter starts, the drum is stopped at the master eject position (drum HP).
- The cutter moves backwards and forwards. While the cutter travels towards the rear (non-operation side), it cuts the master. The motor turns in one direction. The cutter returns to the home position when it reaches the rear because of the two different spiral threads on the screw shaft.
- The cutter usually cuts a master of about 470 mm in length.

After cutting, the drum starts turning again to wrap the remaining part of the master around the drum. The leading edge of the master that was cut remains at the cutting position, ready to make the next master.

MASTER FEED

6.5.5 MASTER SET COVER SENSOR

[A]: Master set cover sensor

[B]: Master set cover

- If the cover is closed properly, the release button [C] rises.

6.6 DRUM

6.6.1 OVERVIEW

Procedure

Ink is supplied inside the drum, through the drum shaft.

The ink roller [A] and the doctor roller [B] spread the ink evenly on the screens.

Ink passes through the metal screen [C].

Ink passes through the cloth screen [D].

Ink passes through the holes in the master that were made by the thermal head.

Ink reaches the paper.

- NOTE:**
- 1) The drum is driven by the main motor and turns only clockwise (viewed from the front of the machine).
 - 2) The main motor speed and the drum stop positions are controlled by monitoring the motor encoder.
 - 3) The ink pump, which is located inside the drum, supplies ink from the ink cartridge into the drum through the drum shaft.

DRUM

6.6.2 DRUM DRIVE MECHANISM***Mechanism***

Main motor [A] (dc motor)

Belt [B]

Gears [C]

The drum only rotates in one direction (CW, viewed from the front of the machine).

NOTE: 1) The main motor encoder sends pulses to the main motor control board (1000 pulses = 360 degrees).

2) The CPU monitors the pulses and controls the drum speed and stop positions.

3) The drum has two sensors;

- Master eject sensor [D] (master eject position and drum home position)
- Feed start timing sensor [E]

4) The drum has two stop positions;

- Master eject (drum home) position
- Master feed position (feed start timing sensor + 111 pulses)

6.6.3 INK SUPPLY MECHANISM

Mechanism

Ink pump motor [A]

Gears [B]

Gear rotation converted into piston motion.

Supplies ink from the ink cartridge to the ink roller via the pump [C]. Ink drops through holes in the ink roller [D].

NOTE: There are four holes in the shaft for the B4 size drum, and two holes for the Legal size drum.

DRUM

6.6.4 INK ROLLER MECHANISM**Mechanism**

Main motor

Gears [A]

Ink roller [B] rotates

Gears [C]

Doctor roller [D] rotates

The doctor roller squeezes the ink on the ink roller to produce an even thickness of ink on the ink roller.

- NOTE:** 1) The ink roller drive gear [E] has a one-way clutch to prevent the ink roller from being turned in reverse if the drum is manually turned in the reverse direction.
- 2) The ink roller does not touch the metal screen when the machine is not printing.
- 3) During printing, the ink on the ink roller is applied to the paper through the holes in the screens and the master. This happens when the press roller [F] under the drum moves up to press the drum screen and the master against the ink roller. (📖 **CT**: Digital Duplicators – Ink Supply Control)

6.6.5 INK SUPPLY CONTROL

Mechanism

When the ink level is low, the pins [A] do not touch the ink.

The ink pump motor (●6.6.3) keeps the ink level normal by supplying ink when the level is low.

- NOTE:**
- 1) The ink detection pins [A] detect the capacitance between the ink roller [B] and doctor roller [C].
 - 2) If the pins detect an insufficient amount of ink after activating the ink pump motor for 40 seconds, a "no ink condition" is detected. The add ink indicator on the operation panel will light.
 - 3) There is an ink supply mode, which is useful when installing a new drum. When the "Clear/Stop" key is pressed while holding down the "0" key, the drum turns 40 rotations to supply ink inside the drum.
 - 4) The ink roller blades [D] on both ends of the ink roller scrape off the built-up ink on the ends of the ink roller.

DRUM

6.6.6 DETECTION OF MASTERS ON THE DRUM

[A]: Drum master sensor

[B]: Black patch on the screen

[C]: Black patch on the clamber

- The drum master sensor [A] detects whether there is a master on the drum.
- When there is a master on the drum, the black patch [B] is covered and the sensor detects the light reflected from the master. When there is no master on the drum, the black patch [B] is exposed. The black patch does not reflect light back to the sensor. Because of this, the master eject process can be skipped when a new master is being made, if no master is detected on the drum.

6.7 PAPER FEED

6.7.1 OVERVIEW

This mechanism feeds blank copy paper into the printer. (🖨️📖: Handling Paper – Paper Feed – Paper Feed Methods – Friction Pad)

Mechanism

The paper table is lifted manually.

The feed roller [A] and the separation pad [B] only allow one sheet to pass.

The registration rollers [C] feed the paper.

The print is made.

NOTE: 1) The main motor drives the feed roller.
2) A dedicated stepper motor (registration motor) controls the registration roller.

PAPER FEED

6.7.2 PAPER FEED MECHANISM**Mechanism**

Main motor [A]

Belt and gears

Paper feed clutch [B]

Turns the paper feed roller [C]

- NOTE:** 1) The machine uses a friction pad [D] and feed roller system. (📖 **CT**):
Handling Paper – Paper Feed – Paper Feed Methods – Friction Pad)
- 2) When the feed roller stops and paper is fed by the registration rollers, the one-way clutches in the feed roller ensure that these rollers do not resist paper feed.
- 3) The guides [E] help to feed paper that is not perfectly flat. The guides are not used normally.

6.7.3 PAPER FEED / SEPARATION PRESSURE MECHANISM

[A]: Standard position (35 to 81.5 g/m², 9.3 to 21.6 lb.)

[B]: Thick paper position (81.6 to 127.9 g/m², 21.7 to 34.0 lb.)

- The user can change the feed roller pressure by changing the position of the pressure adjustment lever [A].
- If paper feed jams frequently occur, the lever should be moved to adjust the pressure.
- If non-feed or multi-sheet feed problems still occur, the paper separation pressure can also be adjusted using the separation pressure slider [C].
- The default position of the slider [C] is position 3.
- By loosening then moving the screws [D] up or down, the spring [E], which applies pressure to the friction pad block [F], moves up or down. (This should be done by a technician; 3.7.3)
- The default position of the screw [D] is at the lowest position.

6.7.4 REGISTRATION ROLLER MECHANISM

Registration Roller Drive

Registration motor [A]

Belt [B]

Turns the lower registration roller [C]

NOTE: 1) The CPU controls the registration roller start timing to synchronize the print paper with the image on the master on the drum.
2) The motor speed depends on the selected printing speed.
3) By pressing the image position keys on the operation panel, the registration motor start timing is changed.

Registration Roller Up/Down Mechanism

- After the printing paper is caught between the drum and the press roller, the registration motor stops and the upper registration roller [A] is released from the lower registration roller. This is to prevent interference from the registration rollers while the drum and press roller transport the paper.
- When the high point of the cam [B] on the drum drive gear reaches the cam follower [C], the shaft [D] rotates clockwise (as seen from the operation side) to release the upper registration roller [A] from the lower registration roller.

6.7.5 REGISTRATION SENSOR CLEANING

NOTE: This mechanism is attached only for the China model.

Dust on the registration sensor [A] can be removed by operating a lever [B]. The technician should do this every visit.

6.7.6 PRINTING PRESSURE MECHANISM

- When not in the printing cycle, the two solenoids [A] remain off and the stoppers [B] lock the brackets [C] to keep the press roller [D] away from the drum.
- When the 1st sheet of paper is fed, both solenoids are energized but the brackets are still locked by the stoppers due to strong tension from the springs [E].
- When the high points of the cams [G] on the front and rear drum flanges reach the cam followers [F] on both sides of the press roller shaft, a small clearance is made between the stoppers and the brackets. The two solenoid plungers are pulled down at the same time, releasing the stoppers from the brackets.
- Printing pressure is applied by the tension from the springs [E] when the cam followers [F] come off the high points of the cams [G].
- During the printing cycle, the solenoids remain on. However, if paper does not reach the registration sensor [H] at the proper time (when the cam follower is on the high point of the cam), the solenoids are de-energized to lock the brackets.
- The printing pressure is released when the cams push down the cam followers so that the press roller does not contact the master clasper [I].
- After printing is finished, the solenoids de-energize and the springs push the stoppers back. Before the drum returns to the home position, the stoppers lock the brackets again when the cams push down the cam followers.

Detailed
Descriptions

6.7.7 RE-FEEDING MECHANISM

If the registration sensor detects a non-feed, the machine will try again. However, if the machine detects a non-feed the second time, the following three indicators light: “A jam indicator”, “⚠”, “🛑”. Also see ‘Paper End Detection’.

6.7.8 PAPER TABLE MECHANISM

Table lifting / lowering

Mechanism

The user moves the paper feed tray adjustment lever [A] up or down.

↓
Link and spring
↓
Plate [B]
↓
Lift or lower the paper table.

- When the user raises the paper feed tray adjustment lever [A], the plate [B] lifts the paper table to the paper feed position.

Paper end detection

There is no paper end sensor.

The registration sensor detects when the paper on the table runs out. Then, the following three indicators light: “A jam indicator”, “%r”, “”.

NOTE: This is the same condition as the paper jam detected during the refeed process (section 6.7.7); the machine cannot distinguish between these two conditions. The user must check for both a paper jam and a paper end condition at this time.

After the front cover is opened and closed, only the paper end indicator will remain lit.

Table side fence lock mechanism

The lock levers [A] hold the side fences in position.

Side fence friction pads

- The two side fence friction pads [A] are included as accessories. These are not used normally, but if paper multi-feed frequently occurs, the friction pads can be installed to apply stopping pressure to the paper. These are especially useful when thin paper is used.
- The users can install the side fence friction pads if they are using thin paper.

6.8 PAPER DELIVERY

6.8.1 OVERVIEW

Procedure

The exit pawl [A] and the air knife [B] separate the paper from the drum.

The paper is fed to the paper delivery table [C] by the paper delivery unit [D].

The paper exit sensor [E] is used for jam detection. (➡4.4.6)

6.8.2 PAPER DELIVERY UNIT DRIVE MECHANISM

Mechanism

Main motor [A]

Belt and gear [B]

Shaft [C]

Rotates the transport belts [D].

NOTE: 1) The vacuum fan motor inside the unit holds the paper against the belts [D] to deliver the paper to the delivery table.

2) The transport belt rotation speed depends on the selected print speed.

6.8.3 PAPER SEPARATION FROM THE DRUM

Air knife

- The air from the air knife fan motor [A] separates the paper from the drum.
- The air knife fan motor starts blowing air when the print start key is pressed or when master cutting is finished. The paper passes under the exit pawl and is delivered to the delivery table.

6.8.4 EXIT PAWL DRIVE MECHANISM

- During printing, the distance between the exit pawl [A] and the drum is very small, to prevent paper wrap jams. However, when the master clamber [B] approaches the exit pawl (as the drum turns), the pawl has to be moved away from the drum to prevent it from being damaged by the master clamber. This is controlled by the front drum flange [C], which is cam-shaped, and the cam follower [E] on the exit pawl shaft.
- When the cam follower is not pushed out by the drum flange, the exit pawl closely approaches the drum surface, due to the tension from a spring [G].
- As the master clamber approaches the exit pawl, the high point of the drum flange cam [C] moves into contact with the cam follower [E] pushing it down. This moves the cam follower arm [F] downwards. The pawl shaft turns clockwise to move the pawl away from the drum.

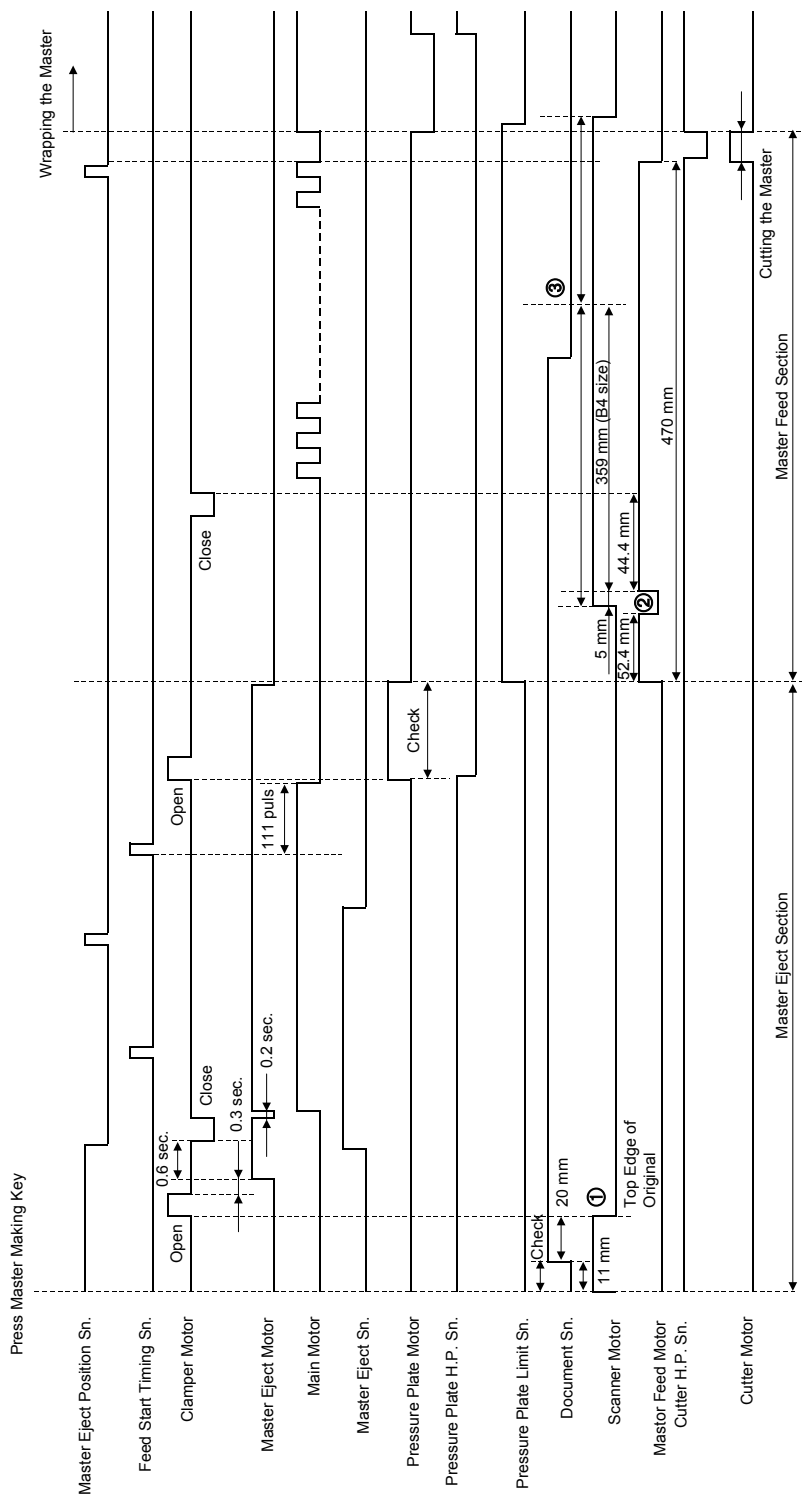

PAPER DELIVERY

- When printing finishes and the printing pressure is released, the cam follower arm [F] is engaged by the printing pressure release arm [D] and held in the lower position. Therefore, after printing finishes, the cam follower is out of contact with the cam, and the exit pawl moves away from the drum to its normal position.

6.9 TIMING CHART

6.9.1 MASTER EJECT / MASTER FEED

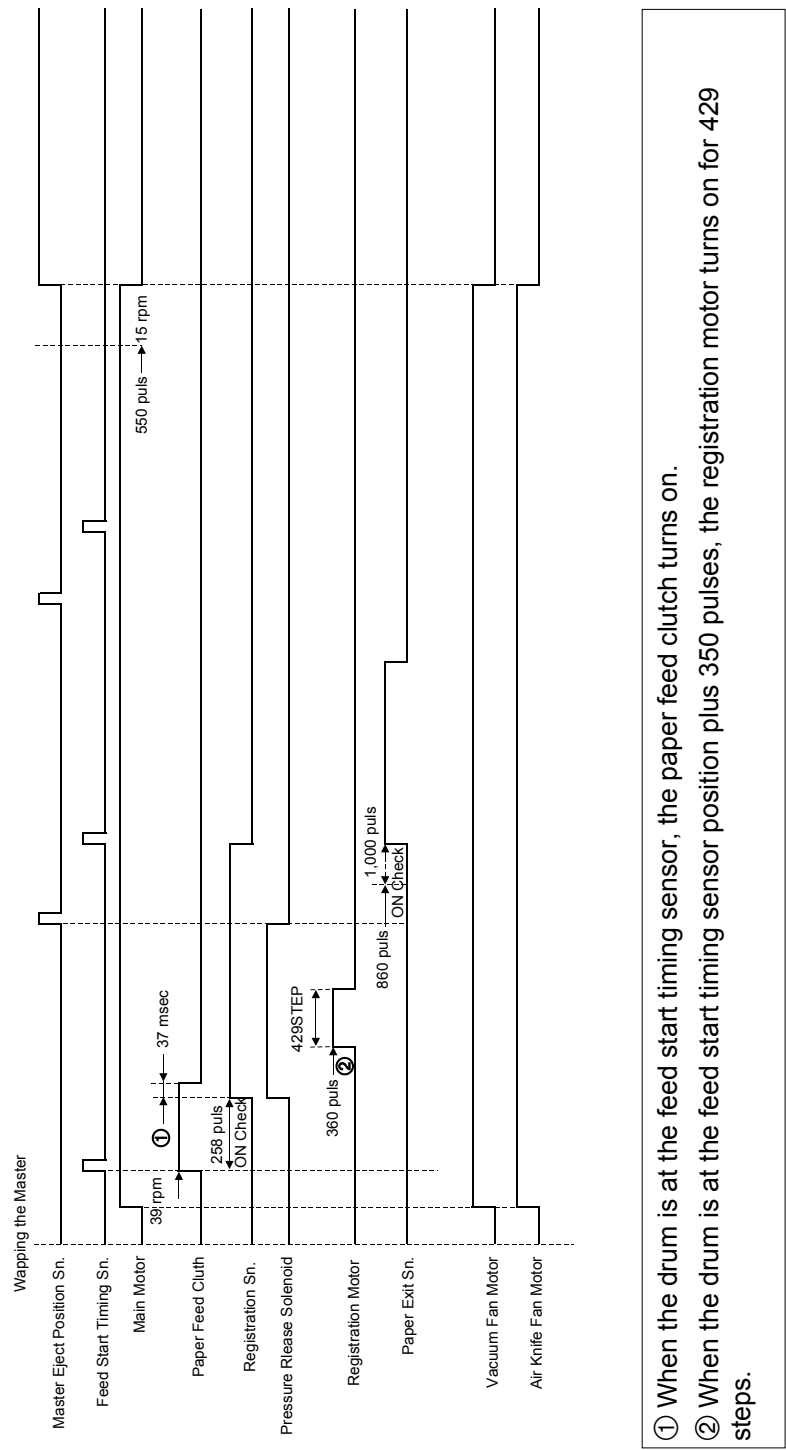

- ① When the scanner motor has fed the original 20 mm since the document sensor turned on, the scanner motor stops.
- ② After scanning 5 mm, the master feed motor turns on.
- ③ After master making, the scanner motor feeds the original out at high speed.

Detailed
Descriptions

TIMING CHART

6.9.2 MASTER WRAPPING

6.9.3 PRINTING

- ① When the drum is at the feed start timing sensor, the paper feed clutch turns on.
- ② When the drum is at the feed start timing sensor position plus 348 pulses, the registration motor turns on for 429 steps.
- ③ When the drum is at the master eject position sensor (drum home position), the drum rotates at the selected printing speed (default: 90 rpm).
- ④ The drum stops at the master eject position sensor (drum home position)

CÓPIA NÃO CONTROLADA

OVERALL INFORMATION

The C261 is released as the successor to the C252. A new model code assigned to the C261, it is in full compliance with the RoHS and WEEE directives.

This service manual details information unique to the C261 and some additional contents for the C261 for servicing in the field. Please add the manual insert into your C252 Service Manual.

Comments for Each Section:

C252/C261: Some additional contents to the C252/C261 service manual (these contents apply to both the C252 and C261 models).

C261 only: These contents are only for the C261 model.

Service Manual:

Section	Item	Remarks
1	Installation	Some new contents concerning the installation were added. <ul style="list-style-type: none"> • Accessory check • Installation procedure
2	Preventive maintenance	No differences
3	Replacement and adjustment	Some new contents concerning the replacements and adjustments were added. <ul style="list-style-type: none"> • Close screen • Clamper/Metal screen • Ink pump adjustment • Vacuum fan motor position
4	Troubleshooting	Some new contents concerning troubleshooting were added <ul style="list-style-type: none"> • Others
5	Service table	No differences
6	Detailed section descriptions	Some new contents concerning the detailed section description were added. <ul style="list-style-type: none"> • Image processing flow (C261 only) • Registration guide plate • Detection of master on the drum (C261 only) • Metal screen • Paper delivery unit drive mechanism (C261 only) • Main control board
7	Point to point diagram	Separated from Service Manual.
Spec	Specifications	No differences

1. INSTALLATION

1.2 INSTALLATION PROCEDURE

1.2.1 MAIN BODY

Accessory check

Description

Change: The accessories are changed (C261 only).

3. Operating Instructions	1
5. Model Name Plate	1
8. Easy Operation Guide	1
9. Safety Information (C261-93 and C261-94 only)	1
10. Bundled Items List (C261-76 and C261-78 only)	1

Installation procedure

C252/C261: Remove the front tape, the tag and the rear tape after step 2. Then do step 3.

Remove the front tape [A], the tag [B], and the rear tape [C].

NOTE: NOTE: To remove the rear tape, pull the portion shown in the diagram toward the front of the machine.

These tapes were also used in the C252.

Change: C252/C261: Note the way to install the master roll.

Reason: To set the master leading edge at the correct position.

7. Set the leading edge of the master in the correct position, as shown.

NOTE: The leading edge of the master does not enter the interior of the master making unit, because the part at the arrows [A] is convex.

1.2.2 ADDITIONAL DRUMS (OPTION)

The following drums are for RoHS compliance.

NOTE: The following drums can be used in the C252.

There are two drum units:

- B4 size Color Drum: Color Drum Type 20 (B4)
- LG size Color Drum: Color Drum Type 20 (LG)

3. REPLACEMENT AND ADJUSTMENT

3.9 DRUM

3.9.2 CLOTH SCREEN

Change:

C252/C261: The mylar seal of the metal screen was changed only at the sides.

C252/C261: The cloth screen was changed to an all-in-one design (belt cloth).

- The metal screen (➡ 6.6.7)

NOTE: The procedure for installation was not changed.

Installation

- Do not scratch the cloth screen or metal screen.
- Properly insert the edge of the belt crossing [A] on the cloth screen under the mylar [B] on the metal screen, as shown above. Otherwise, ink will leak from the trailing edge of the master on the drum during a long printing run.

- Make sure that the correct side of the screen is facing up. In addition, make sure that the stays for securing the cloth screen are positioned correctly. (Refer to the upper right illustration.)
- When replacing the cloth screen, spread the screen around the metal screen while strongly pulling the stay [C]. Adjust the stay so that it is parallel to the master clamber, then tighten the screws.

Make sure that the cloth screen is not wrinkled while spreading it around the drum.

3.9.3 CLAMPER / METAL SCREEN

Change:

C252/C261: Notes about the method for overlapping the metal screen are added.

NOTE: The procedure for installation was not changed.

- Remove the drum
- Cloth screen (☞ 3.9.2)

[A]: Clamber lever (1 hexagon screw)

[B]: Clamber - open the clamping plate [C], then remove the clamber.

- NOTE:**
- 1) Do not allow ink to get on the inside of the clamping plate [C]. Otherwise, the master may slip off and the image position on the prints will move toward the trailing edge of the prints during a printing run.
 - 2) Use a cloth dampened with water to clean the inside of the clamping plate [C]. Never use alcohol or other solvents, or the clamping force of the magnet will be weakened.

[D]: Metal screen (☞ x 12)

[E]: Tape (do not lose it)

- Make sure that the correct end of the metal screen is overlapping. (The right side overlaps, as viewed from the non-operation side, as shown above.)
- Secure the metal screen with filament tape.
- The 4 screws holding the drum master clumper are longer than the 12 screws holding the metal screen, although they are similar in appearance. Be careful not to mix them up or use the wrong screws.
- When installing the metal screen, secure the trailing edge first with the 2 screws. Then, tighten the other screws while removing the slack from the screen. Make sure that the gap between the drum flanges and the screen is 0.3 mm or less, as shown above. (The two holes [A] on the trailing side are round holes and the other holes are long holes, to allow for the removal of the slack.)
- Position the springs [B] and [C] (one each at the front and rear) as shown when reinstalling the drum master clumper [D].
- Do not scratch the cloth screen or metal screen.

3.9.4 INK PUMP ADJUSTMENT

Change:

C252/C261: To improve the accuracy of the adjustment, the plunger adjustment was changed.

Purpose: To ensure the smooth operation of the ink pump plunger by properly positioning its holder.

- Remove the drum
- Cloth screen (☛ 3.9.2)
- Clamper / Metal screen (☛ 3.9.3)

1. Remove the E-ring [A] to free the plunger from the pump drive slider [B].
2. Loosen the two screws securing the holder [C]. (Do not remove the holder.)
3. Push the plunger [D] until it reaches the bottom.

NOTE: The end of the plunger [D] should not project outside from the holder [C].

4. Check that the piston motion is smooth.
5. If the motion is stiff, loosen the pump screws [E] and adjust the pump position.

6. After tightening, repeat step 4 and step 5.

7. Re-tighten the two screws [A].
8. Check that the piston motion is smooth.
9. Reinstall the E-ring [B].

3.10 PAPER DELIVERY

3.10.3 VACUUM FAN MOTOR POSITION

Change: The vacuum fan motor [A] position is the same for all models.

Reason: The type of the fan motor was changed from a 'sirocco vane' type to an axial fan motor, to improve the performance of paper delivery.

4. TROUBLESHOOTING

4.5 OTHERS

These procedures also apply to the C252.

Subject: Black line on the copy

Symptom

The left or/and right edges of the original can be seen on the printout as black lines.

Cause

1. The paper tray side fences are not aligned with the scanner unit side fences.

Or

2. The original is smaller than the printing paper.

NOTE: The C252 and C261 have the following limitations.

- The machine cannot detect the original size or printing paper size.
- The machine makes the master image onto two sizes only: 253mm x 358mm (B4 model) or 216mm x 358mm (LG model). It does not change the size of the master image to match the size of the original or printing paper.

Solution

For cause 1:

1. Measure the distance from the paper edge to the black line (this distance is 'X mm').
2. Move the side fences a distance of about X mm, so that the edge of the paper aligns with the edge of the original.
3. Check the print results. Repeat this until you cannot see the black line on the printout.

For cause 2:

1. Decrease the image density setting, or
2. Increase the magnification setting so that the original size matches the print paper size.

Subject: Areas of the original that are of an orange color do not show on the master.

Symptom

Areas of the original that have an orange color do not appear on the master, but areas in other colors do appear.

Solution

Select 'Letter' for the Type of Original (Letter) and select 'Darker' for the Image Density (Darker) at the same time.

NOTE: The C252 (main firmware: C2525105F or newer) and C261 can use this countermeasure.

6. DETAILED SECTION DESCRIPTIONS

6.4 IMAGE PROCESSING

6.4.1 IMAGE PROCESSING FLOW

Grayscale Processing:

Change:

C261 only: The Text/Photo mode was added. Text/Photo mode: Error diffusion (Text is reproduced better than with Photo mode.)

6.7 PAPER FEED

Registration guide plate

C252/C261: Paper feed is more stable, because the guide plate brings the paper in more close to the drum, and the amount of room at this location has reduced the occurrence of wrinkling for thin paper.

6.6 DRUM

6.6.6 DETECTION OF MASTER ON THE DRUM

Drum master sensor

Change:

C261 only: A VR (Variable Resistor) [A] was added for this sensor. This VR is for factory use only. Do not adjust it in the field.

6.6.7 METAL SCREEN

Change:

- C252/C261: The metal screen was changed to improve image production on the paper.

The flow of ink is shown above. The excess ink travels back to the inside of the drum from the leading edge of the metal screen.

The adhesive parts [A] are only at the sides of the mylar seal for the metal screen. (They were removed from the trailing edge.) This prevents ink leakage from the trailing edge.

The leading edge of the mesh on the metal screen is reduced by 2.5 mm [B]. This prevents small dots at the leading edge of the paper.

6.8 PAPER DELIVERY

6.8.1 PAPER DELIVERY UNIT DRIVE MECHANISM

Change:

- C261 only: The paper delivery performance was improved by changes to the vacuum fan motor and the transport belts.

Vacuum fan motor:

The type of fan was changed from a sirocco vane motor [A] to an axial fan motor [B].

Advantages of the axial fan motor

- The area of suction is larger, so paper delivery is more stable.
- The installation position of the fan motor is not changed. This is the best location for stable delivery of thin paper.

Transport belt:

The transport belts [C] are wider.

Advantage of a wider belts

- The area of the paper that touches the belts is larger. This increases the force applied to the paper during delivery.

6.10 MAIN CONTROL BOARD

- C252/C261: An explanation about the main control board was added.

The main motor controller board [A] is attached to the main motor as shown above. It is part of the main motor assembly. Do not separate the main motor from the controller board.

These machines do not have a separate main motor controller board.

NOTE: Models other than the C252/C261 have a separate main motor control board.
